Organization of the Central Research Institute of Electric Power Industry
# Contents

1. **Outline of Research Activities**
   CRIEPI’s R&D Portfolio in FY2012 (Pillars of research and eight research laboratories) ................................................................. 1

2. **Major Research Results**
   Priority Subjects / Priority Subjects with Limited Terms

   **Establishment of Optimal Risk Management**
   - Policy toward Sustainable Structures and Regulations for Electric Utilities .......................................................... 6
   - Analysis for Energy Saving and Environmental Policy - A Harmonized View of Economic Rationality and Energy Security ...... 8
   - Scientifically and Economically Rational Scenarios to Reduce CO₂ Emissions ............................................................... 10
   - Safety Assessment of LWR Systems ............................................................................................................................. 12
   - Improvement of Safety Assessment Technologies on External Natural Hazards for Nuclear Facilities .............................. 14
   - Assessment of Radioactive Material Diffusion in the Environment and its Remediation Effectiveness .............................. 16
   - Development of Fire Modeling Methodology for Nuclear Power Plant Applications ...................................................... 18
   - Quantitative Evaluation of Low-Dose Radiation Risk and its Reflection on Radiation Protection ........................................ 20
   - Development and Systematization of Long-Term Safety Assessments .......................................................................... 22
   - Development of Long-Term Storage Management Technologies for Spent Fuel ....................................................... 24
   - Development of a Prediction Method for Meteorological and Climatic Impact on Power Facilities ................................. 26
   - Establishment of Protective Measure Technologies against Damages of Overhead Transmission and Distribution Facilities Caused by Wind and Snow ........................... 28
   - Development of Lightning Risk Management Schemes ..................................................................................................... 30

   **Further Improvement of Facility Operations and Maintenance Technologies**
   - Integrity Assessment of Aged LWRs .......................................................................................................................... 32
   - Development of Life Assessment Technology for High Temperature Structural Components of High Chromium Steels .......... 34
   - Development of Techniques for Comprehensive Impact Assessment of Thermal Power on Atmospheric Environment ........ 36
   - Development of Technologies for Supporting Construction and Maintenance of Power Plants from the Viewpoint of Biodiversity Conservation ......................................................... 38
   - Synthesis System of Numerical Analysis for the Currents and Sediments in Rivers and Reservoirs .............................. 40
   - Demonstration of a Simplified Treatment Technique for PCB Contaminated Transformers ................................................. 42
   - Development of a Maintenance Scheme for Aged Power Transmission and Distribution Facilities ........................................ 44
   - Development of Soundness Assessment Techniques for Aged Overhead Transmission Steel Towers ......................................... 46

   **Development of a Supply/Demand Infrastructure for Next-Generation Electric Power**
   - Improvement of Operation and Control Technologies to Diversify Fuel Types for Pulverized Coal-Fired Power Plants .......... 48
   - Development of Upgrading Technology for Low-Grade Energy Resources ......................................................................... 50
   - Development of Enhanced IGCC and Low Carbon Technologies ........................................................................................ 52
   - Assessment of System Security with High Penetration of Photovoltaics ..................................................................... 54
   - Development of a Next-Generation Coordination System for Power Demand and Supply ...................................................... 56
Next-Generation Communications Network Systems .................................................. 58
Evaluation of the Feasibility of Demand Response Suitable for Japan .......................... 60
Development and Evaluation of Advanced Heat Pumps ........................................... 62
Development of High-Performance SiC Power Semiconductors ................................. 64
Establishment of Evaluation Technologies for High Performance Secondary Batteries ..... 66
Evaluation of Energy Efficiency in Commercial Kitchens ........................................... 68
Acceleration of Electrification with Electric Vehicles and Secondary Battery Systems ...... 70

**Basic Technology Subjects**
